Sequence 30453, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
TITLE OF INVENTION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING
TITLE OF INVENTION: ABENDANCE: 107196.136

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT APPLICATION NUMBER: US/09/252,991A

PRIOR RILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           APPLICANT: Gary Eneton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING

ity lipoprotein binding protein 2 (LBP-2).

poprotein binding protein 2; LBP-2; LDL; human; .s; antiarteriosclerotic; therapy; diagnosis; vaccine

The present sequence is that of novel human low density lipoprote binding protein 2 (LBP-2). The amino acid sequence was deduced from coding region of isolated genomic DNA (see AAP26499). It differs sequence predicted from an LBP-2 cDNA clone (see AAB82803) by the presence of an additional 321 amino acids at the N-terminus (the clone is 5' truncated Human LBP-2 cDNA clone (see AAB82803) by the presence of an additional 321 amino acids at the N-terminus (the presence of an additional 321 amino acids at the N-terminus (the clone is 5' truncated). Human LBP-2 cDNA clone (see Didding to national and analogues of LBPS, polywuclectides encoding LBPS, as expression vectors, cells and methods of producing the LBPS.

Polypeptides having amino acid residues 329-343, 329-354, 344-354, 534 (see AAB82809-12) of the present sequence are claimed. Method determining an agent for use in treating atherosclerosis, methods: creating a cell having an abnormality in structure or metabolism care claimed. Pharmaceutical compositions comprising an LBP polypel content acid, and vaccine compositions, are also claimed. New isolated low density lipoprotein binding polypeptide for trea diagnosing and/or identifying therapeutic agents for atherosclero Law SW, Arjona AA; Claim 13(j); Fig 7A; 143pp; English. WPI; 2001-565505/63. N-PSDB; AAH26494.

The present sequence is that of the N-terminal portion of novel hun density lipoprotein binding protein 2 (LBP-2). The amino acid seque deduced from an isolated partial cDNA clone (see AAH26494). A full-sequence is given in AAB82866. Human LBP-2 is an example of claimed polypeptides of the invention that are capable of binding to native methylated low density lipoproteins. Also claimed are biologically fragments and analogues of LBPs, polynucleotides encoding LBPs, as as expression vectors, cells and methods of producing the LBPs method of determining if an animal is at risk for atherosclerosis, methods of determining an agent for use in treating atherosclerosis, and method treating a cell having an abnormality in structure or metabolism of are claimed. Pharmaceutical compositions comprising an LBP polypept uncleic acid, and vaccine compositions, are also claimed New isolated low density lipoprotein binding polypeptide for treat: diagnosing and/or identifying therapeutic agents for atheroscleros: Claim 13(g); Fig 7B; 143pp; English.

```

discloses a composition comprising two or more isolated rat nucleotides or a polymucleotide which represents a fragment, allelic variation of the nucleic acid sequence. Also vector comprising the novel polymucleotide, a host cell vector, a method for identifying a nucleotide sequence remnially regulated in an animal subjected to pain and a nime method, an array, a method for identifying an agent or decreases the expression of the polymucleotide sequence or decreases the expression of the polymucleotide sequence remially expressed in neuronal tissue of a first minal Dain, a method for identifying a compound which regulates i of a polymucleotide sequence which is differentially in animal subjected to pain, a method for identifying a regulates the activity of one or more of the

```
polynucleotides, a method for producing a pharmaceutical composit method for identifying a compound or small molecule that regulates activity in an animal of one or more of the polypeptides given in specification, a method for identifying a compound useful in trea pain and a pharmaceutical composition composition comprising the one or more polypeptides or their anibodies. The polymuclectide or the compon modulates its activity is useful for preparing a medicament for ti
                                                                                                                                                                         pain (e.g. spinal segmental nerve injury (Chung), chronic construitinglary (CCI) and spared nerve injury (SNI) in an animal (e.g. gei therapy). The sequence presented is a human protein (shown in Tab the specification) which is differentially expressed during pain. The sequence date for this patent did not form part of the printes specification, but was obtained in electronic form directly from if the wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              407 MAAMNKEGGTASVATGPDSPSPVPLPPGKPALPGADGTPFGCPPGRKEKPSDPVEW

                                                                            11 - AAE22031 represent DNA sequences encoding human breast and overian cancer. Included in the invention are lowest and overian cancer. Included in the invention are 2032 - AAF22040 and AAE59129 which are used in the characterisation of the DNA and protein sequences of the breast and ovarian cancer associated DNA, protein, agonist sequences exhibit cytostatic; immunosuppressive; nootropic; antiviral; antiallergic; hepatotropic; antidiabetic; y; antiulcer; vulnerary; anticonvulsant; antialacterial; card cardiant activity. The polynucleotide and ess are used in the diagnosis of cancer, particularly can cancer. The nucleic acid sequences, proteins, agonists y also be used in the diagnosis; prevention and treatment ders e.g. Addison's disease, allergies, autoimmune man, autoimmune thyroiditis, diabetes mellitus, Crohn's lesses such as myocardial ischaemias; wound healing; esses such as encebral anoxia and epilepsy; and

nservative

w density lipoprotein binding polypeptide for treating, or identifying therapeutic agents for atherosclerosis.

Law SW, Arjona AA;

)5/63.)0. RS,

```
The present sequence is that of a full-length sequence of novel rated when the present sequence is that of a full-length sequence of novel rated low density lipoprotein binding protein 2 (LBP-2). The amino acid sequence is deduced from an isolated cDNA clone (see AAH26500). Rate LBP-2 is an example of claimed polypeptides of the invention, term LBPs, that are capable of binding to native and methylated low den lipoproteins. Also claimed are biologically active fragments and analogues of LBPs, polyunclectides encoding LBPs, as well as exprevences, cells and methods of producing the LBPs. Polypeptides have mino acid residues 318-35, 318-365, 354-365 or 444-453 (see AAB8 18) of the present sequence are claimed. Methods of determining if an infall is at risk for atherosclerosis, methods for evaluating an a having an abnormality in structure or metabolism of LBP are also contained the pharmaceutical compositions comprising an LBP polypeptide of the paramaceutical compositions comprising an LBP polypeptide or metabolism of LBP are also contained to the pharmaceutical compositions comprising an LBP polypeptide or metabolism of LBP are also contained to the pharmaceutical compositions comprising an LBP polypeptide or metabolism of LBP are also contained to the pharmaceutical compositions and the process of the pharmaceutical compositions comprising an LBP polypeptide or metabolism of the process of the pharmaceutical compositions are pharmaceutical compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Low density lipoprotein binding protein 2; LBP-2; LDL; rabbit; atherosclerosis; antiarteriosclerotic; therapy; diagnosis; vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of a partial sequence of novel rabbit density lipoprotein binding protein 2 (LBP-2). The amino acid sequideduced from an isolated cDNA clone (see AAH36489). Full-length ral LBP-2 is given in AAB82807. Rabbit LBP-2 is an example of claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     19 AAAASSSAASPHYOEWILDTIDSLRSRKARPDLERICRMVRRRHGPEPERTRAELEK

of the invention, termed LBPs, that are capable of binding methylated low density lipoproteins. Also claimed are active fragments and analogues of LBPs, polynuclectides as well as expression vectors, cells and methods of LBPs. Methods of determining if an animal is at risk for is, methods for evaluating an agent for use in treating is, and methods for treating a cell having an abnormality in netabolism of LBP are also claimed, as are pharmaceutical comprising an LBP polypeptide or nucleic acid, and vaccine

low density lipoprotein binding polypeptide for treating, I/or identifying therapeutic agents for atherosclerosis.

ig 4; 143pp; English.

equence is that of a partial sequence of novel rabbit low cotein binding protein 3 (LBP-3). The amino acid sequence is in isolated cDNA clone (see AAR56490). A full-length rabbit LBP-3 is given in AAB58201. Rabbit LBP-3 is an alimed polypeptides of the invention, termed LBPs, that are independently active fragments and analogues of LBPs, is encoding LBPs, as encoding LBPs, as encoding LBPs, as well as expression vectors, cells and aducing the LBPs. Methods of determining if an animal is at cosclerosis, methods for evaluating an agent for use in cosclerosis, and methods for treating a cell having an

```
The present sequence is that of a partial sequence of novel rabbit density lipoprotein binding protein 2 (LBP-2). The amino acid sequed deduced from an isolated cDNA clone (See AAH26488). Full-length rice adduced from an isolated cDNA clone (See AAH26488). Full-length rice LBP-2 is given in AAB82807. Rabbit LBP-2 is an example of claimed to notive and methyler the compositions. Also claimed an isologically active fragments and analogues of LBPs, polymucleotic concoding LBPs, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is at rish atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnormation compositions compositions of LBP are also claimed, as are pharmaceut compositions compositions
abnormality in structure or metabolism of LBP are also claimed, a pharmaceutical compositions comprising an LBP polypeptide or nucl acid, and vaccine compositions

proteins and gene sequences encoding them, useful for enting, and treating disorders such as cancer, sorders and immune system disorders.

le 396-397; 429pp; English.

ide sequences given in AAC59566 to AAC59614 encode the proteins given in AAB34299 to AAB34347. AAB34348 to sent human secreted polypeptide sequences and proteins hem, which are given in the exemplification of the present in secreted proteins have activities based on the tissues genes are expressed in. Example of activities include: a; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; and antibacterial. The polymucleotides can be used for as chromosome markers, and for numerous other diagnostic poses. The secreted proteins can be used to treat as chromosome markers, and for numerous other diagnostic poses. The secreted proteins can be used to treat as neural, immune, muscular, reproductive,

disorders, wound healing, and infectious diseases. The proteins cabe used as a food additive or preservative to increase or decrease storage capabilities. AAC59557 to AAC59565 and AAB34298 represent sequences used in the exemplification of the present invention 8888888

New isolated low density lipoprotein binding polypeptide for trear diagnosing and/or identifying therapeutic agents for atheroscleror

Claim 14(a); Page; 143pp; English.

The present sequence is that of a peptide comprising amino acid roses AAB82806. Human low density lipoprotein binding protein 2 see AAB82806. Human LBP-2 is an example of claimed LBP polypeptic the invention that are capable of binding to native and methylated density lipoproteins (LDLS). Also claimed are biologically active fragments and analogues of LBPS, polynucleotides encoding LBPS, as expression vectors, cells and methods of producing the LBPS.

Colypeptides having the present amino acid sequence are among those claimed. Methods of determining if an animal is at risk for atherosclerosis, and methods for evaluating an agent for use in treatifications compositions of LBP are also claimed, as are pharmaceut compositions. Obte: the present sequence is not shown in the specification but is derived from the human LBP-2 sequence given is figure 7A (see AAB82806)

The invention relates to human nucleic acids (AAI57798-AAI61369) a encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are in munosuppressant and cytostatic activity. The polymucleotides are in gene therapy. A composition containing a polypeptide or polyunc of the invention may be used to treat diseases of the peripheral neuropathy localised neuropathy entropy and system, such as peripheral neuropathy cotalised neuropathies and central nervous system disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activiti'nhibin activity, cancer diagnosis and therapy, drug scream thrombolytic activity, cancer diagnosis and therapy, drug screams assays for receptor activity, arthritis and inflammation, leukaemi. C.N.S disorders. Note: The sequence data for this patent did not fine part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Wan

39.

ption factor polypeptides, used to treat diseases h altered activity and expression of TRFX, and to screen able of modulating its activity.

210; 327pp; English.

quence is the protein sequence for a human transcription anscription factor and its coding sequence are useful in treatment and prevention of diseases associated with sion of the transcription factor e.g. cell proliferative, lammatory, neurological and developmental disorders. A ific disorders/diseases are given in the specification, eriosclerosis, cirrhosis, hepatitis, cancers, AIDS, emia, asthma, autoimmune thyroiditis, bronchitis, atopic abetes mellitus, emphysema, Goodpasture's syndrome, gout, e, multiple sciencis, osteoarthitis, pancreatitis, unacoid arthritis, systemic lupus erythematosus, ulcerative is, Alzheimer's disease, Huntington's disease, Parkinson's e, and viral, bacterial, fungal and protozoal infections

The invention relates to human cell factor signal inhibitor 11.88 (ABPS8930) and nucleic acids encoding it (ABZ57768). The protein landscular weight of 11.88 kD. The invention also relates to a meti the recombinant production of the protein, an antagonist of the prand the use of the protein, gene and antagonist in therapeutic applications. Cell factor signal inhibitor 11.88 can be used in threatment of a variety of diseases such as malignant tumours, bloc diseases, HIV (human immunodeficiency virus) infection, immune diseasers signal inhibitor 11.88
                                                            Human; cell factor signal inhibitor 11.88; recombinant production gene therapy; malignant tumour; cancer; blood disease; HIV infect human immunodeficiency virus; immune disorder; inflammatory condicytostatic; antiinflammatory; immunomodulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide human cell factor signal inhibitor 11.88 and polynucleotides encoding this polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; Page 28 (Disclosure); 34pp; Chinese.

                                                                                                                                                                                                                                                                                                                 New polynucleotides encoding full-length polypeptides, e.g. secret and/or membrane proteins, useful for developing medicines for dise which the gene is involved, or as target molecules for gene therap
                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel human secretory or membrane proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ğa.

Claim 14(a); Page; 143pp; English.

The present sequence is that of a peptide comprising amino acid re 344.354 of novel human low density lipoprotein binding protein 2 (see AAB82806). Human LBP-2 is an example of claimed LBP polypeptid the invention that are capable of binding to native and methylated density lipoproteins (LDIs). Also claimed are biologically active fragments and analogues of LBPs, polymucleotides encoding LBPs, as as expression vectors, cells and methods of producing the LBPs. Polypeptides having the present amino acid sequence are among thos claimed. Methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treati: atherosclerosis, and methods for treating a cell having an abnorma structure or metabolism of LBP are also claimed, as are pharmaceut compositions comprising an LBP polypeptide or nucleic acid, and value of specification but is derived from the human LBP-2 sequence given in figure 7A (see AAB82806)

New isolated low density lipoprotein binding polypeptide for treat diagnosing and/or identifying therapeutic agents for atheroscleros

Claim 14(c); Page; 143pp; English.

The present sequence is that of a peptide comprising amino acid response in the present sequence is that of a peptide comprising amino acid response for novel rabbit low density lipoprotein binding protein 2 see AAB82807). Rabbit LBP-2 is an example of claimed LBP polypeptic the invention that are capable of binding to native and methylated density lipoproteins (LDLS). Also claimed are biologically active in gragments and analogues of LBPs, polymucleotides encoding LBPs, as as expression vectors, cells and methods of producing the LBPs. Polypeptides having the present amino acid sequence are among those claimed. Methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnormal structure or metabolism of LBP are also claimed, as are pharmaceut: compositions. Once: the present sequence is not shown in the specification but is derived from the rabbit LBP-2 sequence given:

To identify antigens of E. tenella that elicit a mucosal immune reduring parasitic infection of chickens, E. tenella cDNA and genom: expression libraries in lambda phage were screened with chicken in bile. Phage that produce antigens cross-reactive with the immune I were identified. The DNA inserts from the positive phage were constructed to sequence analysis. E. tenella bacteriophage M13 and subjected to sequence analysis. E. tenella it.—11e (13.9 kD) was identified. (Updated on 25-MAR-2003 to correct

l describes a novel method for identifying individuals at oping spinocerebellar ataxia type 7 (SCA7). The method yzing the CAG repeat region of a SCA7 gene to detect CAG; individuals at risk have at least 30 CAG repeats and those ive less than 19 CAG repeats. The method is useful for dividuals at risk of developing SCA7 and also those at risk SCA1, 2, 3 or 6. The use of genomic DNA in the repeat ction (RED) analysis allows isolation of any potential repeat expansion regardless of the expression pattern. Idifferent oligonucleotides in the RED assay allows any of rinucleotide repeats to be detected, and the cycled nature in makes it extremely sensitive. This sequence represents a human SCA7 protein which is described in the method of
idividuals at risk of developing spinocerebellar ataxia type trinucleotide repeat regions of spinocerebellar ataxia

The present sequence is that of a peptide comprising amino acid re 444453 of novel rabbit low density lipoprotein binding protein 2 see AAB82807). Rabbit LBP-2 is an example of claimed LBP polypeptic the invention that are capable of binding to native and methylated density lipoproteins (LDLS). Also claimed are biologically active fragments and analogues of LBPS, polymucleotides encoding LBPS, as expression vectors, cells and methods of producing the LBPS.

Polypeptides having the present amino acid sequence are among those claimed. Methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treating at thereselverosis, and methods for treating a cell having an abnorme structure or metabolism of LBP are also claimed, as are pharmaceut comprising an LBP polypeptide or nucleic acid, and variation and variations when the comprising an LBP polypeptide or nucleic acid, and variations and an expension of LBP polypeptide or nucleic acid, and variations and variations and variations and variations and variations are placed and variations and variations and variations are placed and variations and variations are placed and variations and variations are placed and variations and variations and variations and variations are placed and variations and variations and variations are placed and variations and variations are placed and variations and variations and variations and variations and variations are placed and variations and variations and variations are placed and variations and variations and variations and variations are placed and variations and variations and variations and variations and variations and variations are placed and variations and variations and variations and variations are placed and variations and variations are placed and variations and variations and variations and variations and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated low density lipoprotein binding polypeptide for treat diagnosing and/or identifying therapeutic agents for atheroscleros
                                                                Low density lipoprotein binding protein 2; LBP-2; LDL; rabbit; atherosclerosis; antiarteriosclerotic; therapy; diagnosis; vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   compositions. Note: the present sequence is not shown in the specification but is derived from the rabbit LBP-2 sequence given
Rabbit low density lipoprotein binding protein 2 (LBP-2) peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lees AM, Lees RS, Law SW, Arjona AA;

Protein inhibitor of activated STAT, piasy, acidic domian.

Unidentified.

MD AM,

```
The invention relates to an isolated nucleic acid detection reage capable of detecting 1000 or more genes from Drosophila. The invense full in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development insecticides, therapeutics and pharmaceutical drugs. The inventic discloses genomic DNA sequences (ABL16176-ABL30511), expressed DN acquences (ABL16175) and the encoded proteins (ABB3737-ABB32072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format dire from WIPO at ftp.wipo.int/published_pct_sequences
                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or genes from Drosophila and for elucidating cell signaling and cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reages capable of detecting 1000 or more genes from Drosophila.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   describes a purified DNA encoding a potassium (K+) channel tein, KChAP. The K+ channel associated protein (KChAP) es are useful in screening agonists and antagonists of the e, and for making cells having increased numbers of Kv he cellular plasma membrane. Such cells are useful model tudying the effect of pharmacological agents on K channels, on Kv2.1, Kv2.2, Kv1.3 and Kv4.3 channels, and for screening t modulate K+ fluxing by the channels. The KChAP can be useful to produce antibodies specific for the protein. The KChAP may be useful as therapeutics for treating cardiac pretension, angina, asthma, diabetes, renal insufficiency, tinence, irritable colon, epilepsy, cerebrovascular autoimmune disease. This may be acid sequence of itor of activated STAT (piasy), the amino acid sequence of the K+ channel associated protein (KChAP) sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;

1; 66pp; English.

rention describes a modified recombinant allergen in ring form and which is associated with allergic disease sensitive subjects. The modified recombinant allergen allergen into acid sequence modified from the naturally occurring sence such that the allergen lacks or comprises reduced epitopes and/or exhibits reduced binding capacity for IgE is reduced IgE production stimulatory activity while allergen which lacks or comprises reduced numbers and/or exhibits reduced binding capacity for IgE and/or igE production stimulatory activity while retaining Tity, and one or more pharmaceutical carriers and/or (2) prophylaxis or treatment of an allergic disease subject, by administering a modified allergen defined lifted recombinant allergen is useful in the immunotherapy lactic treatment of allergic diseases such as type I

The invention relates to an isolated nucleic acid comprising any to the 6213 antisense sequences given in the specification where exp:

of the nucleic acid inhibits proliferation of a cell. Also include of la a vector comprising a promoter operably linked to the nucleic cacid, an instance of the nucleic acid; and a permoter operably linked to the nucleic nucleic acid; (2) a host cell containing the vector; (3) an isolal polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically be nutisense nucleic acid; (4) an antibody capable of specifically be nucleication or the activity of a gene in an operon required for proliferation or that has an activity against a biological path gene product or that has an activity against a biological path equired for proliferation, or that inhibits cellular proliferation or the biological path agene product or that the fest compound that inhibits proliferation or the biological pathway in which a proliferation-required gene or its gene product or agene on which the test compound that inhibits proliferation or the test compound that inhibits or organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the trains; or (13) identifying the target of a compound that inhibit proliferation of an organism. The antisense nucleic acids are useful infentifying proteins or screening for homologous nucleic acids recide acids act drug discovery programs, or for screening homologous nucleic acids acids acids actids act
                                                                                                                                                                                                                                                                                                                                                                      Antisense; prokaryotic essential gene; cell proliferation; drug de
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense nucleic acids, useful for identifying proteins or s
for homologous nucleic acids required for cellular proliferation
isolate candidate molecules for rational drug discovery programs.

Desensitizing patients to polypeptide allergens.

Example 6; Page 64; 117pp; English.

This invention describes a novel method of desensitizing a patient polypeptide allergen and comprises administering to the patient a derived from the allergen where restriction to a MHC class II mole opsessed by the patient can be demonstrated for the peptide and t peptide is able to induce a late phase response in an individual w possesses the MHC class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and including ragweed) pollens, fungi and moulds, foods, stinging ins the chiromidae (non-biting midges), spiders and mites, housefly, for fly, sheep blow fly, screw worm fly, grain weevil, silkworm, honey non-biting midge larvae, bee moth larvae, mealworm, cockroach, lar Tenibrio molitor beetle, mammals such as cat, dog, horse, cow, pig sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be u produce immunological vaccines which may be used to prevent and/or conditions involving hypersensitivity to allergens. This sequence

relates to a novel method for desensitising an individual polypeptide antigen. The method comprises administering a at contains polypeptide antigens in an amount that he individual a state of hyporesponsiveness to the antigen slitisation to one or more polypeptide antigens. The method on has immunomodulator activity, and may have a use in gene omposition and method are useful in manufacturing a desensitising an individual to a selected polypeptide generating in the individual a state of hyporesponsiveness to allow desensitisation to one or more polypeptide present sequence is used in the exemplification of the
                                            an individual to a selected polypeptide antigen comprises a composition containing polypeptide antigens in an amount a state of hyporesponsiveness to the antigen to allow

noids and peptides derived from open reading frame X, thing e.g. cancers, proliferative disorders, ve disorders and cardiovascular disease.
                                                                                                                                         3968-3969; 5507pp; English
```

the human ORFX open reading frames 1 to 3161. The ORFX activities such as: cytostatic; hepatotropic; vulnerary; antiparkinsonian; nootropic; neuroprotective; osteopathic; antiparkinsonian; nootropic; neuroprotective; osteopathic; antiparkinsonian; nootropic; antidabetic; hypotensive; immunosuppressant; immunosuppressant; immunosuppressant; immunosuppressant; immunosuppressive; antiparterial; immunosuppressive; antihartamatory; antibacterial; fungal; antirhenmatic; antithyroid; antiharterial; fungal; antirhenmatic; antithyroid; and antihanemic. The used for determining the presence of or predisposition and or treating pathological conditions associated with an idisorder. The nucleic acids can be used to express ORFX is therapy vectors. The proteins and nucleic acids may be ancers, proliferative disorders, neurodegenerative ioarthritis, graft vs host disease, cardiovascular disease, us, hypertension, hypothyroidism, cholesterol ester ic lupus erythematosus, severe combined immunodeficiency iral, bacterial or fungal infection, malaria, autoimmune ima, allergies, aplastic anaemia, burns, wounds, bone and je, nocturnal haemoglobinuria, antihifammatory disease; to ttion; to inhibit thrombosis; and as a contraceptive

Gaps 0 1.9%; Score 10; DB 3; Length 322; 4.7; hes 0; Indels 100.0%; Pred. No. 4.7 :ive 0; Mismatches ity 100.0

Twence is the protein sequence of a human polypeptide me that exhibits increased expression in colon cancer-ses compared to normal colon tissue. It is an example of tides that are encoded by genes which are differentially lastestaic colorectal cancer cells. Such polypeptides are nostic and prognostic assays, for raising antibodies useful therapy, and in screening for modulator compounds of

oral induction gene, used for producing plants with of transition from the vegetative to the flowering stage. 80pp; English. epresents the maize chromosome 1 indeterminate (Id) a zinc finger regulatory protein that plays a crucial role from vegetative to reproductive development, controlling of other genes required for floral development. Loss of Id; prolonged vegetative development. Understanding the lis regulation provides a basis for producing specialized to flower and produce seed independent of native internal frommental effects. Methods are provided for producing ected times of transition from the vegetative to the

flowering stage. They can result in either earlier cessation of vegetative growth and initiation of flowering, or in later flowering the absence of floral induction. The plante can be induced to flow set seed prior to adverse weather. Similarly, flower induction can prolonged for short-season plants grown in areas with long periods warm weather. As a result of the extra vegetative mass and carbohy these plants can produce more and/or larger flowers and, consequen more seed. Plants can even be prevented from flowering, thus provinutritious silage biomass. They can also be used to eliminate the for detasseling in the production of hybrids

Novel polypeptide referred to as indeterminate 1 from ryegrass or species, useful for modifying plant life cycles and growth phases flowering processes, plant architecture, inflorescence, flower development

Example 2; Fig 7; 80pp; English.

The present invention describes a substantially purified or isolate polypeptide (I) from a ryegrass (Lolium) or fescue (Festuca) specific from indeterminate I (IDI) and IDI-like proteins, its functionally fragments and variants. Polyucolectide sequences (II) encoding (I) used for modifying plant life cycles and/or growth phases such as the lowering processes, (Inwering and plant architecture, inflorescent flower development. (II) can also be used as a genetic marker. (I) can be used for facilitating immunological screening of cDNA (II) can be used for facilitating immunological screening of cDNA (II) can be used for facilitating immunological screening of cDNA (II) can be used for facilitating immunological screening of cDNA (II) can be used for facilitating immunological screening of cDNA corporation probes to screen libraries from the desired plant. (I useful in amplification protecols to amplify longer nucleic acid on nucleic acid fragments encoding homologous genes for DNA or RNA. (I also useful as a molecular genetic marker for quantitative trait IV (QTL) tagging, QTL mapping, DNA fingerprinting and in marker assist

The polynuclectides and polypeptides are useful for treating inflammatory conditions such as arthritis, nephritis, crot disease, ischaemia-reperfusion injury, shock, sepsis, immune respond and cancer and for promoting wound healing. The sequences are used induce the proliferation of neural cells and regeneration of nerve hervon system disease and neuropathies, such as Alzheimer's disease Parkinson's disease and amyotrophic lateral activity, regulation of hemmatopoiesis, treatment of checking activity, regulation of hemmatopoiesis, treatment of myolod or lymphonic lateral activity, regulation of hemmatopoiesis, treatment of myeloid or lymphonic and platelet disorders such as thromboyytopenia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  regeneration of bone, cartilage, tendon, ligament and/or nerve tiss growth, tissue repair, healing of burns, incisions, ulcers, treatme osteoporosis, osteoarthritis, bone degenerative disorders and peric disease. The sequences of the invention are also useful for gut
                                                                                              Ga
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human novel polynucleotides and associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel nucleic acids and polypeptides for diagnosis, treatment of inflammatory, autoimmune, nervous system, myeloid or lymphoid cell disorders, cancer and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Wang

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

Claim 20; SEQ ID NO 55869; 103pp; English.

The invention relates to isolated polymucleotide (1) and polypept sequences. (1) is useful as hybridisation probes, polymerase chair reaction (PGN) primers, oligomers, and for chromosome and gene may and in recombinant production of (II). The polymucleotides are all in diagnostics as expressed sequence tags for identifying expressing genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) useful for generating antibodies against it, detecting or quantitic polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and (II) and (III) are useful in medical in of sites expressing (II). (1) and (II) are useful for treating di involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodivant on acid sequences. ABGONOIO-ABG30377 represent novel human diagramina acid sequences and sequences amino acid sequences of the invention. Note: The sequence data for patent did not appear in the printed specification, but was obtain electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

construction and membrane transport (MCT) proteins given in AAB76 AAB76847. The MCT nucleic acids and proteins are useful in the infentification of microorganisms which can be used to produce fin chemicals, for modulating fine chemical production in C. glutamic related bacteria (e.g. Brevibacterium lactofermentum), the trybing identification of C. glutamicum or related bacteria, as reference for mapping C. glutamicum or related bacteria, as reference for mapping C. glutamicum genome, and as markers for transformatic example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Corynebacteium glutamicum nucleic acide encoding membrane constru
and membrane transport proteins or their portions, useful for typ
identifying C. glutamicum or related bacteria, and as markers for
transformation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAF67743 to AAF68080 encode the Corynebacterium glutamicum membra

relates to an isolated nucleic acid detection reagent secting 1000 or more genes from Drosophila. The invention is slopmental biology and in elucidating cell signalling and therapeutics and pharmaceutical drugs. The invention of therapeutics and pharmaceutical drugs. The invention of the sequences (ABL16176-ABL30511), expressed DNA 101840-ABL16175) and the enroded proceins (ABBS7737-sequence data for this patent did not form part of the fication, but was obtained in electronic format directly tpp.Wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ım glutamicum; brevibacterium lactofermentum; MCT; ;utction and membrane transport protein; petroleum spill; sgradation; gram positive aerobic bacterium; marker; 1; microorganism; fine chemical production; transformation; 1; genetic engineering.
                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acid detection reagent for detecting 1000 or more osophila and for elucidating cell signaling and cell-cell

scheic acid detection reagent for detecting 1000 or more sophila and for elucidating cell signaling and cell-cell

2 ID NO 22179; 21pp + Sequence Listing; English.

relates to an isolated nucleic acid detection reagent acting 1000 or more genes from Drosophila. The invention is lopmental biology and in elucidating cell signalling and tractions in higher eukaryotes for the development of herapeutics and pharmaceutical drugs. The invention nic DNA sequences (ABL16176-ABL30511), expressed DNA 1840-ABL16175) and the encoded proteins (ABB57737-Sequence data for this patent did not form part of the ication, but was obtained in electronic format directly ip.wipo.int/pub/published_pct_sequences

The invention relates to constructing (M1) a strain of diploid fucile in which both alleles of a gene are modified, comprising more allele by inscribing or replacement by a casestete having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterolo promoter. So that expression of the second allele is regulated by promoter. (M1) is useful for constructing a strain of diploid furcells in which both alleles of a gene are useful for identifying a gis essential to the survival or growth of a fungus, a gene that contributes to the resistance of a diploid fungus to an antiagent, an antifungal agent that inhibits the growth of a fungus, and for identifying a therapeutic agent for treatment of a mammal agent, an antifungal abent that inhibits the growth of a diploid and for identifying a therapeutic agent for treatment of a mammal crivity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, translational, signal transduction, DNA replication and cell divice ability to inhibit growth or prolifezation of C. albicans cells a treating infection by C. albicans. The present sequence is that of essential candida albicans protein used in the method of the inverse specification but is based on sequence information supplied to De the burners of the control of t
                                                                                                 Constructing strains for identifying gene products as effective t for therapeutic intervention, by inactivating in the strain one a a gene and placing other allele of the gene under conditional exp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ü

The invention relates to recombinant yeast with improved productivethyl caproate by introducing mutations intonto fatty acid synthet (ABB08801). The yeast is used for improved productivity of ethyl conthous decreasing the fermentation characteristic features of year present sequence is that of the yeast fatty acid synthetase mutant. The present sequence is not shown in the specification but is derificent the yeast fatty acid synthetase sequence given as SEQ ID NO 1
                                                                                                                                                                                                                                                                                                                                     Yeast; fatty acid synthetase; ethyl caproate; fermentation; enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant yeast for improved productivity of ethyl caproate, producing food, comprises a mutated fatty acid synthetase gene.

The invention relates to multiprotein complexes from eukaryotes. I of the invention and DNA sequences encoding them are given in recomplexed-ABR5368-ABR53903 and ACC6610-ACC61944 respectively. The complexe obtainable by using a protein as a bait and isolating the set of which is attached thereto from cells. Such protein complexes may cup to 30 distinct proteins. Protein complexes of the invention are for diagnosing a disease or disorder, or as a target for an active of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for the patent is not represented in the printed specification, but is bas sequence information supplied by the Buropean Patent Office. The c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated protein complexes useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Kuester BD;

The invention relates to three hundred and five nucleic acids encomplete people of the secreted and transmembrane). The PRO nucleic acip polypeptides are useful for the manufacture of a medicament for diagnosing or treating tumour in a mammal, for measuring or detect expression of an associated gene, for stimulation of chondrocytes stimulating the release of tumour necrosis factor alpha (NRP-alpha human blood. The present sequence represents the amino acid sequence acted and transmembrane PRO protein. Note: The sequence data for a patent din not form part of the printed specification but was obtained sequence format directly from USPTO at sequence the patent and the present of the printed specification but was obtained substantial and the present of the printed specification but was obtained substantial processions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; secreted and transmembrane protein; PRO; chromosome mapping

The invention relates to an isolated PRO polypeptide. The PRO nuc sequences are useful as hybridisation probes in chromosome and ge mapping, for stimulating the release of tumour necrosis factor—all stimulating proliferation of release of tumour necrosis factor—all stimulating proliferation of underly of chondrocyte cells detecting the presence of tumour in a mammal, or in generating an RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules in in binding reaction, to generate transgenic animals or knockout a in binding reaction, to generate transgenic animals or knockout a cherapeutically useful reagents, for chromosome identification an typing. The PRO polypeptides and nucleic acid molecules are also in gene therapy, and as molecular weight markers for protein checkphoresis purposes. The anti-PRO acid molecules may be used in diagnostic assays for PRO, or for the affinity purification of PRO recombinant cell culture or natural sources. The present sequence of a secreted and transmembran

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicu mare useful for identifying the mutation point of a gene derived funtant of coryneform bacterium, measuring expression amount and a toorneform bacterium, and identifying a homologue of a gene derived for coryneform bacterium, and identifying a homologue of a gene derive coryneform bacterium. Coryneform bacteria and conjunction of a particularly L-lysine. The present sequence is a protein describe exemplification of the invention. Note: The sequence data for thi did not form part of the printed specification, but was obtained electronic format directly from the European Patent Office

The present sequence is a polypeptide encoded by one of a large nu present sequence is a polypeptide encoded by one of a large nu prepared from mRNAs encoding secreted proteins. The 5' ESTs is prepared from total human RNAs or polyA+ RNAs derived from 30 diff tissues. EST sequences usually correspond mainly to the 3' untrans region (UTR) of the mRNA because they are often obtained from olig primed cDNA libraries. Such ESTs are not well suited for isolating sequences darived from the 5' ends of mRNAs and even in those case longer cDNA sequences have been obtained, the full 5' UTR is rarel included. 5' ESTs are derived from mRNAs with intact 5' ends and c therefore be used to obtain full length cDNAs and genomic DNAs. 5' are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory se and to design expression and secretion vectors
 New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedur

 A libraries which can be used for gene therapy or in polynucleotides of the invention and antibodies encoded by ed in the prevention, diagnosis and treatment of diseases in inappropriate polypeptide expression. The products of the also be used to identify modulators of expression and odwn regulate expression and activity. The antibodies of may also be used as diagnostic agents for detecting the lypeptides in samples. This sequence represents a homologue de described in the disclosure of the invention
 describes novel polynucleotides and polypeptides isolated
 having the sequences of clones isolated from libraries of n tissues, useful in recombinant DNA methodologies.

To identify antigens of E. tenella, expression libraries were prilambda vector, lambda gt11, using cDNA prepd. from polyA mRNA iscfrom E. tenella oocysts. The cDNA expression library was screened monoclonal antibody (MAD) 12.07 which was raised against the spostage of E. tenella. The library to be screened was plated on a lallows lysis and plaque formation. During induction of the antigencoded by the phage, the plaques were identified by screening thilters with MAD 12.07. The cDNA inserts from the MAD 12.07 posiphage were cloned into bacteriophage M13 and subjected to sequence analysis. Following sequence analysis, E. tenella antigen tc-10a identified. (Updated on 25-MAR-2003 to correct PA field.)
 ര
 Pope SH, Strausberg SI
 eimer:
 Vaccine against avian coccidiosis - comprising recombinant eime antigen ac-18 or ac-6b gene, or microorganisms expressing them.

```
The invention relates to an isolated polypeptide associated with growth, differentiation and death (GGDD). Also disclosed are the growth, differentiation and death (GGDD). Also disclosed are the polypeptides encoding the polypeptides. The polypeptides and polymucleotides encoding the polypeptides. The polypeptides and polymucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression (expression of CGDD. Such diseases include cell proliferative (e.g. expression of CGDD. Such diseases include cell proliferative (e.g. expression of CGDD. Such diseases include cell proliferative (e.g. expression of cGDD. inflammatcory (e.g. AIDS, allergies) and reporductive disorders, or disorders of the placents. They are a regul in assessing the effects of exogenous compounds on the exp of mucleic acid and amino acid sequences of CGDD. The CGDD or its fragments are useful in screening compounds that specifically bink modulate the activity of the polypeptide. Microarrays consisting of polymucleotides of the invention are useful in monitoring or meas protein-protein interactions, duug-target interactions, and gene expression profiles. Sequences given in records AAR69655 represent CGDD polypeptides of the invention

    I relates to isolated polynucleotide (I) and polypeptide (II) (I is useful as hybridisation probes, polymerase chain (P) primers, oligomers, and for chromosome and gene mapping, than the production of (II). The polynucleotides are also used is as expressed sequence tags for identifying expressed useful in gene therapy techniques to restore normal (II) or to treat disease states involving (II). (II) is nerating antibodies against it, detecting or quantitating a in tissue, as molecular weight markers and as a food (II) and its binding partners are useful in medical imaging ressing (II). (I) are useful for treating disorders example (II) are useful for treating disorders examples (II) are useful for the forter for the forter forter for the forter fort
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ind polymucleotide sequences have applications in forensics, gene mapping, identification of mutations for genetic disorders or other traits to assess biodiversity et other types of data and products dependent on DNA and equences. ABG00010-ABG30377 represent novel human diagnostic aquences of the invention. Note: The sequence data for this t appear in the printed specification, but was obtained in 'pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ification; signal transduction pathway; metabolic pathway; assay; genetic mapping; gene expression control; promoter; sequence; corn.

The invention relates to a single exon nucleic acid probe for men human gene expression in a sample derived from human foetal live: single exon nucleic acid probes may be used for predicting, measingle exon nucleic acid probes may be used for predicting, measingle exon nucleic as a peptide encoded by a single exon nucleic as of the invention. Note: The sequence date for this patent did not part of the printed specification, but was obtained in electronic directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
discloses genomic DNA sequences (ABL16176-ABL30511), expressed D. sequences (ABL01840-ABL1617) and the encoded proteins (ABB57737 ABB72072). The sequence data for this patent did not form part o printed specification, but was obtained in electronic format direction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; foetal liver; gene expression; single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide #6936 encoded by human foetal liver single exon probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 27; SEQ ID NO 32065; 639pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                       à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                        Invention relates to human single exon nucleic acid probes 110068-AA128459). The present sequence is a peptide encoded probe. The SENPs are derived from human HeLa cells. The SENPs or produce a single exon microarray, which can be used for an gene expression in a sample derived from human cervical lls. By measuring gene expression, the probes are therefore ding and/or staging of diseases of the cervix, notably ser. Note: The sequence data for this patent did not form rinted specification, but was obtained in electronic format NIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 relates to an isolated nucleic acid detection reagent etecting 1000 or more genes from Drosophila. The invention is velopmental biology and in elucidating cell signalling and creations in higher eukaryotes for the development of therapeutics and pharmaceutical drugs. The invention
                                                                               derived single exon nucleic acid probes useful for analyzing on in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic acid detection reagent for detecting 1000 or more rosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

By measuring gene expression, the probes are useful for predictin diagnosing, grading, menitoring and prognosing diseases human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Negeuence data for this parent did not form part of the printed specification, but was obtained in electronic format directly fro at fit, wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to single exon nucleic acid probes measuring human gene expression in a sample derived from human he ABA21535-ABA41305). The present sequence is a protein encoded by probe. The probes may be used for predicting, measuring and displ gene expression in samples derived from the human heart via micro

The invention relates to a single exon nucleic acid probe (SENP) measuring human gene expression in a sample derived from human at liver, comprising one of 13109 defined nucleotide sequences given specification (or complements fragments). The probe hybridises stringency to a nucleic acid molecule expressed in the human adu. (I) may be used for predicting, measuring and displaying gene exi in samples derived from human adult liver. The genes identified involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia
                                                                                                      probes which are derived from genomic sequences expressed in the brain. They can be used to measure gene expression in brain cell which may enable the diagnosis and improved treatment of nervous diseases such as Alzheimer's disease, multiple sclerosis, schizo epilepsy and cancers. The present sequence is a protein encoded the probes of the invention
Single exon nucleic acid probes for analyzing gene expression in brains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for gene expression in human adult liver.
                                                                                          present invention provides a number of single exon nucleic
                                                                                                                                                                                                                                                                                                                       ·

of single exon nucleic acid probes, used to expression in human lung samples. ressable set

ID NO 32211; 634pp; English.

relates to a spatially-addressable set of single exon probes for measuring gene expression in a sample derived ng comprising single exon nucleic acid probes having one of acid sequences mentioned in the specification, or their r the 12387 open reading frames derived from the 12614 included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic d in the human lung; measuring gene expression in a sample human lung, comprising (a) contacting the array with a

collection of detectably labeled nucleic acids derived from human mRNA, and (b) measuring the label detectably bound to each probe array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequenct the eukaryote; and (b) detecting specific hybridisation of detect labeled nucleic acids from eukaryote lung mRNA, to a single exon having a fragment identical to the predicted exon; the probe is in the above mentioned microarray; assigning exons to a single ge comprising (a) identifying exons from genomic sequence by the met above and (b) measuring the expression of each of the exons in setissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern compression of the exons in the tissues and/or cell types indicate the exons should be assigned to a single gene; a peptide comprisit of 12011 sequences, mentioned in the specification, or encoded by compression and for identifying exons in a gene, particularly using analysis, and for identifying exons in a gene, particularly using analysis, and for identifying exons in a gene, particularly using analysis, and for identifying exons in a gene, particularly using analysis, and for identifying exons in a gene, particularly using a person procession of the study of lung diseases such as astic cancer, chronic obstructive pulmonary disease (COPD), interstitia disease (ILD), familial idiopathic pulmonary fibrosis, neurofibro tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Herm Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar protei Karagener syndrome, fibrocystic pulmonary dysplasia, primary cili dyskinesis, pulmonary hypertension and hyaline membrane disease. present sequence is a peptide/protein encoded by a single exon pr the invention. Note: The sequence data for this patent did not for of the princed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
